theories of visual perception 3rd edition provides clear critical accounts of several of the major approaches to the challenge of explaining how we see the world it explains why approaches to theories of visual perception differ so widely and places each theory into its historical and philosophical context coverage ranges from early theories by such influential writers as helmholtz and the gestalt school to more recent work in the field of artificial intelligence this fully revised and expanded edition contains new material on the minimum principle in perception neural networks and cognitive brain imaging

visual perception explores fundamental topics underlying the field of visual perception including the perception of brightness and color the physics of light and the optics of the eye although the text leans heavily on physical and physiological concepts explanations of the relevant physics and physiology are considered this book is organized into 16 chapters and begins with an overview of the relationship between information assimilation and the physiology of the visual system based

on data gathered both in physiological and perceptual experiments more specifically this text discusses the nature of the human perceptual system in terms of the kinds of information that are assimilated from the world and how this selection of information is governed by the structure of receptors and the neural circuits that are connected to them the relationships between symbols and their corresponding physical and physiological variables are also examined finally the book addresses the presence of strong lateral inhibition in the visual system and how it fits the concept of evolution this book is aimed at undergraduate and graduate students regardless of their academic backgrounds

vision is our most dominant sense from which we derive most of our information about the world from the light that enters the eye and the processing in the brain that follows we can sense where things are how they move and what they are the first edition of visual perception took a refreshingly different approach to perception starting from the function that vision serves for an active observer in a three dimensional environment this fully revised and expanded new edition continues this approach in contrast to the traditional textbook treatment of vision as a catalogue of phenomena following a general introduction to the main theoretical approaches the authors discuss the historical basis of our current knowledge placing the study of vision in its historical context they look at how our ideas have been shaped by art optics biology and philosophy as well as psychology visual optics and the neurophysiology of vision are also described the core of the book covers the perception of location motion and object recognition there is a new chapter on representation and vision including a section on the perception of computer generated images this readable accessible and truly relevant introduction to the world of perception aims to elicit both independent thought and further study it will be welcomed by students of visual perception and those with a general interest in the mysteries of vision

if you've ever been tricked by an optical illusion you'll have some idea about just how clever the relationship between your eyes and your brain is this book leads one through the intricacies of the subject and demystifying how we see

this comprehensively updated and expanded revision of the successful second edition continues to provide detailed coverage of the ever growing range of research topics in vision in part i the treatment of visual physiology has been extensively revised with an updated account of retinal processing a new section explaining the principles of spatial and temporal filtering which underlie discussions in later chapters and an up to date account of the primate visual pathway part ii contains four largely new chapters which cover recent psychophysical evidence and computational model of early vision edge detection perceptual grouping depth perception and motion perception the models discussed are extensively integrated with physiological evidence all other chapters in parts ii iii and iv have also been thoroughly updated

this book presents a collection of articles reflecting state of the art research in visual perception specifically concentrating on neural correlates of perception each

section addresses one of the main topics in vision research today volume 1 fundamentals of vision low and mid level processes in perception covers topics from receptive field analyses to shape perception and eye movements a variety of methodological approaches are represented including single neuron recordings fmri and optical imaging psychophysics eye movement characterization and computational modelling the contributions will provide the reader with a valuable perspective on the current status of vision research and more importantly with critical insight into future research directions and the discoveries yet to come provides a detailed breakdown of the neural and psychophysical bases of perception presents never before published original discoveries includes multiple full color illustrations

if you want to know about the secrets of human perception of the visual system then this book will help you unravel the secrets of visual information answer the questions what do you see why so see and how to manage the process of perception of visual information in a compact form the primary processes of sensation at the level of the sensory system their further perception by the brain are considered the basic concepts of visual perception of spatial forms and color compositions are described in a fascinating form using author s images the author uses years of experience teaching the discipline so the book can be useful for anyone interested in the features of the psychology of visual perception

this book presents an interdisciplinary overview of the main facts and theories that guide contemporary research on visual perception while the chapters cover virtually all areas of visual science from philosophical foundations to computational algorithms and from photoreceptor processes to neuronal networks no attempt has been made to provide an exhaustive treatment of these topics rather researchers from such diverse disciplines as psychology neurophysiology anatomy and clinical vision sciences have worked together to review some of the most important correlations between perceptual phenomena and the underlying neurophysiological processes and mechanisms the book is thus intended to serve as an advanced text for graduate students and as a guide for all vision researchers to understanding current progress outside their specialized fields of interest i examines parallel processing of visual informationi discusses links between physiologically measured receptive fields and psychophysically measured perceptive fieldsi presents a spatial sampling by the retina and cortical modulesi covers signal transduction and the sites of adaptationi describes a single cell analysis of attentioni discusses computational models of vision

originally published in 1952 this book was built upon a reconsideration of the findings presented in vernon s 1937 title visual perception the text puts forward the belief and contention that the individual constructs his perceived world as far as possible in accordance with the maintenance of the maximum of stability endurance and consistency an appendix section and indices are also included this book will be of value to anyone with an interest in perspectives on the nature of visual perception

why do we need two eyes why are all cats grey at night and appear to move faster the day why is the sky blue and the setting sun red this book explains the multifaceted nature of perception and discusses the mysteries of vision it provides readers with experiments to help them discover optical illusions and the features of their own perception illusions of seeing begins with a discussion on the essence of light and its perception to the human eye it presents a comprehensive overview of the basic laws of human perception as well as the fundamentals of good gestalt subsequent chapters discuss geometric optical illusions the perception of form brightness and translucency and their interaction with each other ambiguous perception color vision spatial vision the book ends with a discussion of the perception of motion and its interaction with color form and spatial depth with a full chapter devoted to illusions in our everyday life consider this your travel guide in the marvelous world of sight to experience a completely individual way to understand and improve your own perception illusions of seeing will be of interest to psychologists physicists biologists and undergraduate and graduate students within the field of cognitive psychology

attention in vision is an important work which aims to identify address and solve some major problems and issues in the psychology of visual perception attention and intentional control the central aim is to investigate how people use their visual perception in the performance of tasks and to explore how the intentional control of action is achieved through an extensive review of the philosophy of psychology the history of ideas and theories of intentional control and an analysis of various tasks a new theory is developed which argues that there is an important difference between report tasks and act tasks the first section of the book introduces the issues of visual perception in a historical context and outlines van der heijden's theory the theory is developed in the second and third sections by analysing the findings from some of the main experimental paradigms of cognitive psychology and applying the theory to act tasks finally the epilogue skilfully draws together the theory into an explanation of different historical and theoretical perspectives in psychology this book will be invaluable to researchers and high level undergraduates in the field of visual perception and attention

does the world appear the same to everyone does what we know determine what we see why do we see the world as we do vision is our most dominant sense from the light that enters our eyes to the complex cognitive processes that follow we derive most of our information about what things are where they are and how they move from our vision visual perception takes a refreshingly different approach to this enigmatic sense from the function that vision serves for an active observer to the history of visual perception itself the third edition has been extensively revised updated and expanded while still preserving the essential features of historical context neurophysiology and independent thought that made the earlier editions so engaging covering the perception of location motion object recognition and with up to date information on the workings of the visual brain the 3rd edition looks at how our ideas have been shaped not just by psychology but by art optics biology and philosophy the emphasis on understanding vision as a basis for action in the real world has also been expanded to cover seeing representations of all sorts whether they are pictures or computer generated displays the 3rd edition of visual perception is a readable accessible and truly relevant introduction to the world of perception and will be welcomed by students of visual perception as well as anyone with a general interest in the mysteries and wonder of vision

visual perception theory and practice focuses on the theory and practice of visual perception with emphasis on technologies used in vision research and in visual information processing central areas of vision research including spatial vision motion perception and color are discussed light and optics convolutions and fourier methods and network theory and systems are also examined comprised of nine chapters this book begins with an overview of language and processes underlying specific areas of vision such as measures of neural activity feature specificity and individual cells and psychophysics the reader is then systematically introduced to the more essential properties of light and optics relevant to visual perception the use of convolutions fourier series and fourier transform to model processes in visual perception and network theory and systems subsequent chapters deal with the geometry of visual perception spatial vision the perception of motion and some specific issues in visual perception including color perception binocular vision and stereopsis this monograph is intended for students practitioners and investigators in physiology

vision is our most dominant sense from the light that enters our eyes to the complex cognitive processes that follow we derive most of our information about what things are where they are and how they move from our vision
